Hanse Enclave Gurugram

SUMMARY

- Experience in developing solutions using Machine Learning, Deep Learning, NLP and Optimization techniques and LLM.
- Experience in developing data processing pipelines using Python and SQL.
- Experience in performing data analysis/data aggregation using SQL and Pandas.
- Ability to visualize and present data using PowerBI, Dash(Plotly) and Streamlit for presentation.
- Experience in extracting the useful and critical information from data based on EDA and Statistics.
- Experience in building the Rag pipeline using Vectordb, LLM and Huggingface pipeline.

EDUCATION

Gurugram University

Bachelor's of Science

CBSC Board

12th

SKILLS

- **Programming Languages:** Python, R
- **Databases:** MySQL, PostgreSQL
- **Deep Learning:** Pytorch, Tensorflow
- **Machine Learning:** Sklearn, Web
- **Scraping:** BeautifulSoup, Selenium, Scrapy
- **Data Visualization:** PowerBI, Plotly, Matplotlib, Dash(Python)
- **Cloud Computing:** AWS EC2, Lambda, Sagemaker
- **Large Language Model:** Langchain, VectorDB, RAG GenAI
- **Devops:** Git, Docker

CERTIFICATIONS

- Deep learning @Coursera
- Machine learning @Coursera
- LLM and Generative AI @Deeplearning.AI
- SQL for Data Science @Coursera
- Python Data Structures @Coursera
- Advanced Learning Algorithms @Coursera
- Programming for Everybody @Coursera

PROFESSIONAL EXPERIENCE

Freelancing Project

- **Information extraction from unstructured data.**
 - Developed a complete Retrieval-Augmented Generation (RAG) pipeline using LangChain to derive insights from unstructured data.
 - Integrated OpenAI API and Ollama for LLM-driven responses, with practical experience in VectorDB, indexing, and embedding techniques.
 - Utilized ChromaDB to store and efficiently retrieve document embeddings, ensuring scalable and high-performance retrieval.
- **Text to SQL using Langchain Agents**
 - Implemented a Text-to-SQL solution using LangChain Agents for natural language query conversion.
 - Utilized the LLaMA model as the core LLM powering the SQL agent for accurate query generation.
 - Conducted an in-depth analysis of agent behavior and prompt structure to enhance performance and reliability.
- **Build a customer feedback classification**
 - Cleaned and normalized text data using NLTK, and converted it into numerical features with CountVectorizer.
 - Applied Naive Bayes for initial classification, then adopted a BERT model which significantly improved accuracy.
 - Deployed the BERT-based solution on AWS EC2, enabling scalable and efficient text classification.
- **Customer churn prediction and its effect on business**
 - Performed in-depth Exploratory Data Analysis (EDA) on retail customer data to identify patterns related to churn behavior.
 - Collaborated with domain experts to translate EDA insights into business-relevant churn indicators.
 - Built and evaluated multiple models, starting with Logistic Regression and addressing class imbalance using SMOTE.
 - Achieved a 0.95 recall score by implementing and fine-tuning an XGBoost Classifier for accurate churn prediction.
 - Developed a cause-effect model to assess the impact of price hikes on churn, helping optimize pricing for improved profitability.
