SUMMARY

IT professional with 1.5+ years of experience, including 6 months in ServiceNow development. CSA certified with hands-on knowledge of ITSM, UI Policies, Business Rules, Client Scripts, and Service Catalog. Interested in ServiceNow and Data Science role.

SKILLS

ServiceNow, ITSM, Service Catalog, Business Rule, Client Script, UI Policy, Data Policy, UI Action, Flow Designer, Glide API.

EDUCATION

2021 - 2024	Bachelors of Technology - Vishwakarma University	(CGPA: 8.7/10)
2018 - 2021	Diploma in Information technology - AISSMS Polytechnic	(CGPA: 9.1/10)
2017 - 2018	SSC Maharashtra State Board - Bharatiya Vidya Bhavan	(Percentage: 85.80/100)

WORK EXPERIENCE

Diacto Technologies

July 2025

ServiceNow Developer Intern

- Developed robust server-side logic using Glide APIs within Business Rules and UI Actions to streamline backend processing.
- Completed extensive training aligned with the ServiceNow CSA certification, covering platform architecture, core modules, and hands-on labs for real-world readiness and worked as shadowing on project and gained positive feedback
- Automated complex workflows and business processes using Flow Designer, improving operational efficiency.
- Improved user interface responsiveness and interactivity through Client Scripts, UI Policies, and GlideAjax for dynamic client-side functionality.

Erian - Singapore

March 2024 – May 2024

Research and Development Intern

- Created an augmented dataset with 1,000+ car images across diverse environmental conditions to improve model performance. Developed and trained a custom Generative Adversarial Network (GAN) with Generator and Discriminator components to produce realistic automotive images.
- Validated the quality and realism of GAN-generated outputs using the CARLA autonomous driving simulator. Achieved high level accuracy in simulated environment testing, demonstrating the effectiveness of the GAN model for synthetic data generation.

Quick Heal

Aug 2023 – Nov 2023

Data Science Intern

- Conducted an in-depth study on handling high-cardinality categorical variables in structured datasets, which are often challenging for traditional machine learning models due to dimensionality and overfitting issues. Applied and evaluated Linear Regression, observing limitations in performance when using standard encoding techniques such as one-hot encoding and label encoding, especially with variables containing hundreds or thousands of unique values
- Implemented GLMMNet to handle high-cardinality categorical features using fixed and random effects, improving accuracy, reducing overfitting, and enhancing model interpretability in sparse or hierarchical data.

ACHIEVEMENTS

- ServiceNow - Certified System Administrator
- ServiceNow Microcertifications - Welcome to ServiceNow, Flow Designer, Service Portal, Agile Development
- Business Analytics Badge - IBM [Credly](#)
- IBM Hackathon, IBM-ICE Day Hackathon organized by IBM, Pune: 1st Position [Link](#)
- Visionary Club - Co-Founder Vishwakarma University

PROJECT

Project Name : Mercer AI

- **Tech Stack** : ServiceNow, Client Script, UI Policy, GlideAjax, Script Include, Business Rule, ACL, Update Set, Dashboard, Record Producer, GitLab, Import Set, Transform Map
- Developed a custom application on the ServiceNow platform to manage AI device ordering and inventory tracking, streamlining operations for retail businesses
- Automated device validation and data processing using **Client Scripts**, **UI Policies**, **Business Rules**, **Transform Maps**, and **Import Set Tables** to reduce manual errors and handle incomplete business information efficiently.
- Implemented **Access Control Rules** to ensure secure, permission-based access for different groups and roles. Enhanced the using **UI Policies** to dynamically control field visibility, mandatory states, and section display based on defined conditions.
- Developed end-to-end inventory management features by designing **Business Rules** for order-based updates and notifications, creating **Record Producers** for multi-device requests with validations, and building **Performance Analytics Dashboards** for real-time insights on usage, availability, and cost trends.

Smart Waste Bins

- **Tech Stack** : Java, SQL, Machine Learning, IOT, InfluxDB
- Designed and developed an intelligent smart waste bin system leveraging IoT technologies, including weight sensors and ultrasonic transducers, to continuously monitor the fill levels of waste bins. This system collects accurate, real-time data to help reduce manual inspection and optimize waste management operations
- Implemented a real-time alert mechanism that automatically notifies waste collection teams when a bin's fill level exceeds 75% capacity, ensuring timely pickups and preventing overflow issues. This proactive alerting system improves city sanitation and resource allocation
- Integrated GPS tracking with sensor data stored in a time-series database (InfluxDB) to enable dynamic route optimization for waste collectors. By analyzing spatial and temporal data, the solution enhances collection efficiency, reduces operational costs, and supports smarter urban waste management
