SUMMARY

Results-driven technical support professional transitioning to data analysis. Skilled in troubleshooting, data collection, scripting (e.g., Python/SQL), and presenting insights to technical and non-technical stakeholders. Completed self-directed data projects involving EDA, visualization, and predictive modeling. Seeking a Data Analyst role to leverage analytical skills and technical background to drive data-informed decisions.

Technical Skills

Technical Skills: Python (pandas, Numpy, Scikit-learn) | SQL | sheets | GitHub | Jupyter Notebooks

Data Visualization: PowerBi | Matplotlib | Seaborn | Excel (Pivot tables, Charts)

Analytical: EDA | Hypothesis | Regression | Correlation | Machine Learning | Data cleaning

Soft Skills: Problem Solving | Communication | Team work | Research Analysis |

EXPERIENCE

Raksha Technologies | Technical Support Analyst Intern

[Dec 2024] - Present

- Created Excel-based dashboards using pivot tables, slicers, and conditional formatting to visualize weekly SLA compliance, resolution time trends, and workload per agent.
- Automated daily incident reporting using Python scripts (pandas, openpyxl), reducing manual reporting time by over 75% and increasing data accuracy
- Designed a Power BI dashboard for leadership to monitor real-time support KPIs — including ticket volume trends, top 5 recurring issue categories, and average response/resolution time.
- Conducted root cause analysis on critical escalations and presented actionable insights to the IT team, resulting in a 20% reduction in similar incidents over 3 months.
- Collaborated with cross-functional teams to align data definitions and reporting metrics for consistent performance evaluation.
- Analyzed recurring system issues using support ticket data, identifying trends and reducing repetitive incidents by 15%.
- Collaborated with the security team to track and analyze endpoint security logs (CrowdStrike Falcon), highlighting potential threats using Excel-based dashboards.
- Prepared weekly KPI reports using Excel (PivotTables, VLOOKUP) to monitor support SLAs, resolution time, and issue categories.
- Worked closely with IT teams to troubleshoot and document incident root cause analytics, improving future resolution timelines.
- Initiated documentation of support patterns and analytics in Sheets, enabling better data-driven decision-making for resource allocation.

EDUCATION

The New College (University of Madras)

Bachelor of Computer Applications BCA, Chennai, India | 2020 – 2023 | 7.6 CGPA

PROJECTS

Web Scraping & Data Cleaning

- This project aims to extract data from websites for analysis using software to store it in a structured format, such as Excel, JSON, or XML. Language used Python 100%, libraries (panda, bs4, req ,excel)
- This project focuses on scraping data related to TVS Motors, including information on all TVS dealers in India, totaling 3000 entries.

Operational Metrics Dashboard

- Used sample server logs or open IT operations datasets to compute uptime metrics, error rates, and incident trends.
- Built automated data pipeline with Python scripts; loaded results into Excel or Power BI for visualization.
- Recommended monitoring alerts based on threshold breaches, simulating a data-driven support workflow.
