EDUCATION

Indian Institute of Technology, Roorkee	2021 - 2025
Bachelor of Technology	CGPA: 7.0

RELEVANT TECHNICAL SKILLS

Programming Languages	Python, C++, SQL
Programming Frameworks	Pytorch, OpenCV, Huggingface, Tensorflow, Streamlit, Flask, LangChain
Technologies	Machine Learning, Deep Learning, Data Science, LLMs, Gen AI

EXPERIENCE

Data-Driven Operations Optimization for E-Commerce Fulfillment: Mother's Feed	October 2024
- Leveraged Python, SQL, and Pygsheets to track KPIs like Late Order % and brand-wise ATV trends - Increased next-day pickup by 30% by streamlining first-mile operations for marketplace orders - Identified that 5% of SKUs account for 45% of returns and proposed reducing their order volumes - Reduced damaged products from 3% to 0.25%, boosting customer satisfaction and saving costs	
Multi Camera Calibration & 3D Reconstruction System : LBP, IIT Roorkee	January 2024 - April 2024
- Calibrated RealSense D435i cameras using OpenCV and RealSense libraries for precise depth and spatial alignment - Developed 3D facial models with Open3D, focusing on point cloud generation and convex hull meshing - Designed and 3D printed a custom camera stand, capturing facial emotion data for an emotion recognition dataset	

RELEVANT PROJECTS

Tech-Enhanced AI Interview Learning Platform	February 2025
- Developed a platform that curates technical details from the user's resume and conducts tailored interviews based on their resume and the role they are appearing for, leveraging LLMs like GPT-4 for generating interview questions - Integrated Text-to-Speech (TTS) and Speech-to-Text (STT) capabilities using open-source models like Coqui TTS and Whisper for realistic, interactive interview simulations - Post-interview, the platform uses Pratt software to generate detailed analytics and suggestions for improvement	
Machine Translation	January 2025
- Built a Transformer model for machine translation, implementing Encoder-Decoder layers from scratch in Python - Developed classes for Multi-Head Attention, Positional Encoding, and tokenized 300,000 sentences for training	
Real Estate Data Analytics	September 2024
- Developed a machine learning model enabling users to accurately predict property prices, receive personalized recommendations for new properties, and data visualization for deep understanding of the pattern in properties - Implemented Xgboost Regressor with 1500 estimators of depth-4 for predictive modeling, geospatial mapping for visual representation, recommendation based on the selected radius and location, achieving 89% accuracy - Created a Streamlit web app deployed on AWS EC2 instance enabling real-time access to data and insights	
Monte Carlo Simulation using Python	April 2024
- Used Python, NumPy, and Pandas to implement Monte Carlo Simulation to optimize investment portfolios - Applied efficient frontier analysis and Sharpe Ratio maximization to balance risk and return effectively - Developed a financial model to analyze risk and return profiles, offering insights for strategic investment decisions
