PROJECTS

Cryptography The Python-based chatbot utilizes the AES (Advanced Encryption Standard) algorithm to securely encrypt and decrypt messages, ensuring that all communications remain confidential and protected from unauthorized access. By integrating AES encryption, the system safeguards user data, reinforcing trust and enhancing the overall security of chatbot interactions.

Bus Detection System AI and ML concepts are applied in various domains through technologies such as GPS tracking for real-time location monitoring, RFID for accurate identification and authentication, image processing for visual recognition and analysis, and data analytics for efficient monitoring, reporting, and decision-making. These technologies work together to enhance automation, improve accuracy, and support intelligent insights in modern systems.

NewsFlow (A multilingual news classification and sentiment analysis) The system enhances the efficiency of the Press Information Bureau (PIB) by streamlining information dissemination, actively monitoring media coverage, and delivering timely feedback on government policies, programs, and achievements, thereby supporting informed communication and strategic decision-making.
